

ABSTRACT

Described is a packaged hygiene product for receiving body fluids and/or excretions, wherein the hygiene product has a body side facing towards the body and a washing side facing away from the body and can be folded or rolled up for packaging, wherein an adhesive is disposed at least partially at the washing side and wherein there is provided a packaging material which has an inside facing towards the hygiene product and an outside facing away from the hygiene product, wherein the washing side of the hygiene product is fixed to the inside by means of the adhesive. The aim is to develop that hygiene product in such a way that on the one hand the fish mouth effect is avoided and on the other both the packaged hygiene product itself is cheaper to produce and also the machines for the production of the packaged hygiene products are simplified. To attain that object it is proposed that provided in the packaging material is at least one opening through which a surface region of the inside can be fixed to the washing side by means of a part of the adhesive in order to hold the hygiene product in the packaged condition.
